

Faster, On-Brand Web Pages with AI

A simple overview of how our new page-production process works

In short: We built a repeatable process that lets AI (Claude) learn any of our websites and then build brand-consistent new pages from a simple content document — in minutes instead of hours. The result imports straight into the website builder, already matching the site's look, voice, and mobile formatting.

The problem we're solving

Building a new landing or service page by hand is slow and repetitive. Every page has to match the site's colors, fonts, tone of voice, and layout rules — and stay consistent across dozens of pages and multiple client websites. Small inconsistencies creep in, and each page can take hours of manual work in the page builder.

How it works

The process has two parts. First, a one-time **setup** per website, where the AI studies the existing site and learns its brand. After that, producing each new page is a quick, repeatable step.

- 1 Export the website**
We take a standard export of the existing site from the website builder — no coding required.
- 2 AI learns the brand (one time per site)**
The AI studies the real pages and captures the site's exact colors, fonts, writing voice, and layout patterns into a reusable profile.
- 3 Quick quality check**
We confirm the AI understood the brand correctly before building anything.
- 4 Hand over the content**
We give the AI a simple content document for the new page — the headings, text, and key points.
- 5 AI builds the page, we import it**
The AI produces a finished page that matches the brand and is mobile-ready. We import it into the site with one click and publish.

Consistency standards built in

Beyond matching colors, fonts, and voice, the system follows a set of layout rules on every page so results always look tidy and professional:

- **Uniform structure and spacing:** every section is built the same way, so margins and spacing stay even and predictable across the whole page.
- **Calm, consistent buttons:** buttons respond to a hover with a simple color change - no distracting movement or resizing.
- **Room for images where needed:** a section can reserve a clean space for a photo to be added by the team.
- **Mobile-ready by default:** multi-column layouts automatically stack neatly on phones.

Already proven

We ran the full process end-to-end on the **Vital Air** website (an Atlanta HVAC company). From a content document, the AI produced complete, on-brand pages — including a Service Areas page and a city landing page — that imported cleanly and matched the site's existing style and mobile formatting.

What this gives us

Much faster

New pages in minutes, not hours of manual building.

Consistent brand

Every page matches the site's look and voice automatically.

Scales across sites

The same process works for any client website we manage.

Fewer errors

Built-in checks catch mobile and formatting issues before publishing.

What's needed to keep going

Everything is documented and reusable — the setup for each site is done once, then reused for every future page. To roll this out to more websites, we simply run the one-time learning step on each site. The whole system is designed to run with our AI assistant (Claude).

Prepared as a plain-language overview of the AI-assisted Elementor page-production process.
